

Timken Shaft Guarding Technology™

Standard bearing

## A housed unit that makes an impact without making a mark.

Timken® housed units are the only ones that feature Shaft Guarding Technology,™ our patented setscrew locking system that takes the pressure off the shaft and transfers it to a hardened stainless steel band. By eliminating direct shaft-screw contact, this new, easy-to-use technology helps protect the shaft against gouging, raised metal and corrosion that can lead to expensive shaft replacement. It also makes removal much quicker and safer, without the need for cutting tools or torches. If there's a way to reduce friction while increasing your uptime, Timken will find it.
