1.1 Measurement units

1.1 Unidades de medida

Simbolo Symbol	Unità di misura Measurement unit	Definition	Definición
FS'		Gear reducer service factor	Factor de servicio del reductor
FS		Application service factor	Factor de servicio de la aplicación
i_1		Ratio of 1st gear reducer	Relación de reducción del 1° reductor
i_2		Ratio of 2nd gear reducer	Relación de reducción del 2° reductor
i_n		Reduction ratio	Relación de reducción
M_{2S}	[Ft·lb]	Slipping torque	Par de deslizamiento
n_1	[min ⁻¹]	Input speed	Velocidad de entrada
n_2	[min ⁻¹]	Output speed	Velocidad de salida
P	[Hp]	Gear reducer power	Potencia reductor
P'	[Hp]	Power required at input	Potencia de entrada requerida
P_1	[Hp]	Gear motor power	Potencia del motor reductor
P_2	[Hp]	Output power	Potencia de salida
P_{tc}	[Hp]	Corrected thermal power	Potencia térmica corregida
P_{to}	[Hp]	Thermal power	Potencia térmica nominal
F_{r1}	[lb]	Input shaft radial load	Carga radial del eje de entrada
F_{r2}	[lb]	Output shaft radial load	Carga radial del eje de salida
F_{a1}	[lb]	Input shaft axial load	Carga axial del eje de entrada
F_{a2}	[lb]	Output shaft axial load	Carga axial del eje de salida
Rd		Dynamic efficiency	Rendimiento dinámico
Rs		Static efficiency	Rendimiento estático
Ta	[°C]	Ambient temperature	Temperatura ambiente
T_{2M}	[Ft·lb]	Gear reducer torque	Torque del reductor
T_2	[Ft·lb]	Gear motor torque	Torque del motor reductor
T_c	[Ft·lb]	Torque to be used for the selection of the gear reducer	Torque para la elección del reductor
T_2'	[Ft·lb]	Required Torque	Torque requerido

1.2 Power

P = max. power applicable at input with male worm shaft, referred to n_1 speed, service factor FS=1, on S1 continuous duty.

P_1 = recommended motor power, referred to n_1 speed, service factor FS as reported in the table on page 4, on S1 continuous duty.

The necessary input power with regard to T_2 torque required by the application, is to be calculated with the following formula:

$$P' = \frac{T_2' \cdot n_2}{9550 \cdot Rd} \quad [\text{kW}]$$

1.3 Reduction Ratio

i_n = speed reduction ratio, defined as follows:

$$i_n = \frac{n_1}{n_2}$$

1.4 Torque

T_{2M} = max. torque transmissible at gear reducer output with uniform load, referred to n_1 speed, service factor FS = 1, on S1 continuous duty.

T_2 = output torque transmissible to the geared motor, referred to n_1 speed, P_1 power, FS service factor as reported in the table, on S1 continuous duty.

$$T_{2M} = \frac{9550 \cdot P_1 \cdot Rd}{n_2} \quad [\text{Nm}]$$

1.2 Potencia

P = Potencia máxima aplicable de entrada con tornillo y eje macho, en relación a la velocidad n_1 , con factor de servicio FS = 1 y servicio continuo S1.

P_1 = Potencia del motor aconsejable para la velocidad n_1 , con factor de servicio FS detallado en la tabla de la pag. 4 y servicio continuo S1.

Es factible determinar la potencia necesaria de entrada P', en base al par T_2' que la aplicación requiere con la siguiente fórmula:

1.3 Relación de reducción

i_n = Relación de velocidad, definida como:

1.4 Torque

T_{2M} = Máximo par transmisible de salida del reductor con carga uniforme, en relación a la velocidad n_1 , con factor de servicio FS = 1 y servicio continuo S1.

T_2 = Es el par de salida del motor reductor, en relación a la velocidad n_1 y la potencia P_1 , con factor de servicio FS = 1 detallado en la tabla y servicio continuo S1.

1.5 Service factor

Value which takes the different operating conditions into consideration:

- type of application or type of load (A-B-C)
- length of operation (hours per day h/d)
- number of start-ups/hour

This coefficient (FS) will have to be equal or lower than the FS of selected gear reducer FS' given by the ratio between T_{2M} torque mentioned in the catalogue and the T_2 torque required by the application.

$$FS' = \frac{T_{2M}}{T_2} > FS$$

FS values reported in the table refer to the electric motor operation; should a combustion motor be used, consider a multiplication factor of 1.3 for a multicylinder motor, of 1.5 for a single-cylinder one. If an electric brake motor is used, consider a number of start-ups which is twice as much the number actually required.

1.5 Factor de servicio

Es el valor que considera las varias condiciones de funcionamiento:

- Tipología de aplicación o naturaleza de la carga (A-B-C)
- tiempo de funcionamiento (horas diarias h/d)
- número de arranques/hora

El coeficiente hallado (FS) deberá ser igual o menor al factor de servicio a adaptar FS' en relación con el par T_{2M} indicado en el catálogo, y el par T_2 requerido por la aplicación.

El valor FS indicados en la tabla son relativos al accionar del motor eléctrico; si se utiliza un motor a explosión, se deberá tener en cuenta un factor multiplicativo 1.3 para varios cilindros y 1.5 para un cilindro.

Si el motor eléctrico aplicado es autofrenante se considere el doble de arranques de lo que efectivamente se requiere.

Load class Clase de carga	h/d h/d	N. START-UP/HOUR - N. ARRANQUE/HORA

1.6 Selection

Selecting a gear reducer

A) $n_1 = 1750 \text{ min}^{-1}$

Consult the gear reducer unit efficiency table; select a group whose ratio is close to the calculated ratio and which permits power:

$$P \geq P' \cdot FS'$$

Selecting a gearmotor

B) $FS = 1$

Consult the gear motor efficiency table and select a group having power P1 corresponding to calculated P'.

C) $FS \neq 1$

Follow the instructions at point A), checking that the size of the motor to be installed is compatible with the gear reducer unit (IEC); obviously, installed power must correspond to the required P' value.

After having selected the proper gear reducer, it is necessary to check out that possible additional loads (radial or axial) on the input and /or output shafts fall within the values reported in the catalogue. Depending on the application, it might be necessary to check that the power absorbed by the gear reducer does not exceed the thermal power limit reported in the tables of technical data.

1.7 Lubrication

All worm gear reducers X, K, RFV and RCV series, are supplied with synthetic lubricant, PAG base, viscosity index ISO VG 320.

Only for series X and K, the bearings mounted on the input shaft are always supplied with synthetic -base grease for all mounting positions. For mounting positions B6 - B7, the output shaft bearings are also greased to ensure correct lubrication. This means that it is possible to switch from the mounting positions B6 - B7 to all the other positions, changing only the quantities of oil specified in the corresponding tables. Mounting positions B3 - B8 - V5 - V6 can be exchanged without changing the oil quantity.

Choose the lubricant according to operating and ambient conditions in order to ensure high gear unit performance.

Performance data, as shown in the specifications tables, refer to utilization of synthetic oil.

VISCOSITY

It is one of the most important parameters to be considered when selecting an oil; it depends on various factors such as speed and temperature. Following are general guidelines for choosing the correct viscosity:

High viscosity

To be used for low rotation speed and/or high temperatures. (Under these operating conditions a low viscosity causes premature wear).

Low viscosity

To be used for high rotation speed and/or low temperatures. (High viscosity reduces efficiency and causes overheating).

1.6 Selección

Selección del reductor

A) $n_1 = 1750 \text{ min}^{-1}$

Se elegirá en las tablas de prestaciones de los reductores aquellos que en base a la relación calculada admitan una potencia:

Selección del motor reductor

B) $FS = 1$

Consultar en la tabla de prestaciones los motores reductores cuya potencia P1 corresponda a la P' calculada.

C) $FS \neq 1$

La selección deberá realizarse como en el punto A) verificando que el tamaño del motor a instalar sea compatible con los admitidos por el reductor (IEC); lógicamente la potencia instalada deberá corresponder al valor P' requerido.

Determinado el reductor idóneo es necesario verificar que las posibles cargas adicionales (radiales y axiales), agentes sobre el eje de salida y/o de entrada, estén comprendidos entre los valores admisibles por el catálogo.

En determinadas condiciones aplicables, puede llegar a ser necesario verificar que la potencia absorbida por el reductor no supere el límite térmico señalado en el catálogo, según cuanto se indica en tablas de datos técnicos.

1.7 Lubricación

Los reductores de la serie X, K, RFV y RCV se entregan completos de lubricante sintético a base PAG con viscosidad ISO VG320.

Solo para la serie X y K, los rodamientos del eje de entrada siempre están lubricados con grasa de base sintética para todas las posiciones de montaje, solo para las posiciones de montaje B6 - B7, para una lubricación adecuada, los rodamientos del eje de salida también están engrasados. Esto significa que solo desde las posiciones de montaje B6 - B7 es posible cambiar a todas las otras posiciones, modificando solo las cantidades de aceite, como se indica en las tablas relativas; en cuanto a las posiciones de montaje B3 - B8 - V5 - V6, solo pueden ser intercambiables entre ellas, sin cambiar las cantidades de aceite.

La elección cuidadosa del tipo de lubricante, en función de las condiciones operativas y ambientales, permite que los reductores alcancen las óptimas prestaciones.

Las prestaciones de los reductores, indicadas en la tabla de los datos técnicos, fueron calculadas considerando el empleo del aceite sintético.

VISCOSIDAD

Es uno de los parámetros más importantes a tener en cuenta a la hora de seleccionar un aceite, ya que influye directamente en factores tales como la velocidad y la temperatura. A continuación sintetizaremos las líneas generales para la elección de la correcta viscosidad:

Viscosidad alta

Usar para bajas velocidades de rotación y/o altas temperaturas. (Una viscosidad demasiado baja en estas condiciones operativas provoca un desgaste prematuro).

Viscosidad baja

Usar para altas velocidades de rotación y/o bajas temperaturas. (Una viscosidad demasiado alta, reduce la eficiencia y provoca recalentamiento).

ADDITIVES

All mineral oils contain additives to protect against wear, EP (more or less strong), anti-oxidizing and anti-frothing. It is advisable to make sure that the action of such additives is bland and not too aggressive on the seals.

OIL BASE

May be mineral or synthetic. Synthetic oil compensates for the higher cost with a series of advantages :

- lower friction coefficient (consequently improved efficiency)
- better stability over time (possible life lubrication)
- better viscosity index (more adaptable to various temperatures).

Mineral-base oils offer the advantages of costing less and performing better during the running-in period.

ADITIVOS

Todos los aceites minerales contienen aditivos antidesgaste, EP (mas o menos energéticos), antioxidantes y antiespumantes. Es conveniente asegurarse de que estos sean blandos y no agresivos ya que podrían dañar las juntas.

BASE DEL ACEITE

Puede ser sintético o mineral.

El aceite sintético compensa su mayor coste con una serie de ventajas:

- Menor coeficiente de fricción (por consecuencia mayor rendimiento)
- Mejor estabilidad en el tiempo (posible lubricación de por vida)
- Mejor índice de viscosidad (mejor adaptabilidad a varias temperaturas).

El aceite de base mineral es ventajoso por tener un menor coste y un mejor comportamiento en rodaje.

Worm gear reducers

XN

2.1 Characteristics

- X series worm gear reducers are available in the following versions: XF (only size 40) and XC (all sizes except 40) suitable for motor mounting assembling.
- The XF version (bell + joint) suits a wider range of applications and provides higher efficiency than the XC compact version, which actually offers reduced space requirement.
- The enbloc housing is in cast-iron for size 90, in die-cast aluminium for sizes 40, 50, 63, 75 and 89.
- The worm shaft is in case-and quenchhardened alloy steel and ground.
- The worm wheel has a cast-iron hub provided with inserted cast-bronze ring.
- The cast-iron housings are painted BLUE RAL5010 whereas the aluminium housings are sandblasted.
- The hollow output shaft is supplied as standard. A broad range of accessories is available: second input, tapered roller bearings on the worm wheel, output flange, single or double-extended output shaft, torque limiter with through output bore, torque arm, output bore protection kit, torque limiter protection kit.

Reductores sinfin corona

XN

2.1 Características

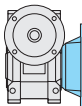

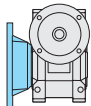

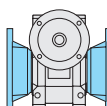

- Los reductores de sinfin corona de la serie X están disponibles en las versiones: XF (solo tamaño 40) y XC (todos los tamaños excepto 40) adecuados para el montaje del motor.
- La versión XF (campana + junta), caracterizada por una amplia versatilidad en los distintos tipos de aplicaciones, presenta un mayor rendimiento con respecto a la serie XC, que a su vez, tiene la ventaja de ocupar un espacio menor.
- La carcasa monobloque es de hierro fundido para el tamaño 90 y para los tamaños inferiores de aluminio fundido bajo presión.
- Los tornillos sin fin son de acero aleado cementado templado y son rectificadas.
- Los dientes de los engranajes realizados en hierro fundido y el anillo en bronce.
- Las carcasas en hierro fundido pintadas de AZUL RAL 5010 mientras que las de aluminio pulidas a chorro de arena.
- Está incluido el eje de salida hueco de serie, con una amplia disponibilidad de accesorios: segunda entrada, cojinetes de bolas sobre el engranaje, brida de salida, eje lento con 1 y dos salidas, limitador de par con agujero pasante, brazo de reacción, kit de protección eje hueco, kit protección limitador de par.

2.3 Lubrication

XN series worm gear reducers are supplied with synthetic lubricant, PAG base, viscosity index ISO VG320. Mounting position always to be specified when ordering.

For more details, see page A5, paragraph 1.7.

2.3 Lubricación

Los reductores de la serie XN se entregan completos de lubricante sintético a base PAG con viscosidad ISO VG320. Se ruega precisar la posición de montaje deseada a la hora de realizar el pedido.

Para más detalles ver página A5 párrafo 1.7

2.4 Terminal board position

2.4 Posición borne

Mounting position always to be specified when ordering. Terminal board position see page B11 (PM=1)

A la hora de realizar el pedido se ruega precisar la posición de montaje y la posición de la caja de bornes. Posición borne v. pág. B11 (PM=1)

2.5 Radial load

Any transmission device coupled to the output shaft generates radial loads Fr_2 .

The load values reported in the table, depending on input and output speed, are to be considered as acting at the half-way point of the projection; if the load is applied at 1/3 of the projection, increase the values in the table by 25%; if the load is applied at 2/3, reduce the values by 25%.

Axial loads applicable at output Fa_2 are reported in the tables.

With regard to double projecting shafts, each end can sustain a radial load which equals 3/5 of the values listed in the table, on condition that they act in the same direction and have the same intensity.

2.5 Cargas radiales

Cada clase de órgano de transmisión que es conectado al eje de salida determina cargas radiales Fr_2 .

Los valores señalados en la tabla en función a las varias velocidades de entrada y salida se suponen aplicándolas en la mitad del eje como fuerzas agentes a esta; para una ubicación de 1/3 de la longitud se aumentará hasta un 25% los valores de la tabla, mientras para una posición de 2/3 de la longitud se disminuirá los mismos valores a un 25%.

Los valores de las cargas axiales aplicables en salida F_{a2} están señalados en las tablas.

En los ejes con salida doble, cada extremidad puede soportar una carga radial igual a 3/5 del valor de la tabla, siempre y cuando las cargas aplicables sean de igual intensidad y reaccionen en el mismo sentido.

Worm gear reducers

KN

3.1 Characteristics

- The KN worm gear reducers are extremely light thanks to the compact shape of the housing, which is in cast iron for size 90, in die-cast aluminium for sizes 50, 63, 75 and 89.
- This series features a wide range of versions, with and without feet, which makes it extremely versatile for utilization in various applications.
- The K series is available for motor mounting version (PAM) only and not with the male input shaft.
- The worm shaft is in case-and quenchhardened alloy steel and ground.
- The worm wheel has a cast-iron hub with inserted cast bronze ring.
- The cast-iron housings are painted BLUE RAL5010 whereas the aluminium housings are sandblasted.
- The hollow output shaft is supplied as standard. A broad range of accessories is available: second input, tapered roller bearings on the worm wheel, output flange, single or double-extended output shaft, torque limiter with through output bore, torque arm, output bore protection kit, torque limiter protection kit.

Reductores sinfin corona

KN

3.1 Características

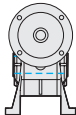

- Los reductores de la serie KN se presentan formidablemente ligeros gracias a su forma compacta de la carcasa en hierro fundido en los tamaño 90 y en aluminio fundido bajo presión para los tamaños 50, 63, 75 y 89.
- La serie presenta varias posibilidades de versiones, con y sin pié, que la hacen aún más adaptable en el uso de cada tipología de aplicación.
- La serie K disponible exclusivamente en las versiones con disposición de enganche motor (PAM) y no con eje con entrada macho.
- Los tornillos sin fin son de acero aleado cementado – templado y son rectificadas.
- Los dientes de los engranajes realizados en hierro fundido y el anillo en bronce.
- Las carcasas en hierro fundido pintadas de AZUL RAL 5010 mientras que las de aluminio pulidas a chorro de arena.
- Está incluido el eje de salida hueco de serie con una amplia disponibilidad de accesorios: segunda entrada, cojinetes de bolas sobre el engranaje, brida de salida, eje lento con 1 y 2 salidas, limitador de par con agujero pasante, brazo de reacción, kit de protección, eje hueco, kit protección limitador de par.

3.3 Lubrication

KN series worm gear reducers are supplied with synthetic lubricant, PAG base, viscosity index ISO VG320. Mounting position always to be specified when ordering.

For more details, see page A5, paragraph 1.7.

3.3 Lubricación

Los reductores de la serie KN se entregan completos de lubricante sintético a base PAG con viscosidad ISO VG320. Se ruega precisar la posición de montaje deseada a la hora de realizar el pedido.

Para más detalles ver página A5 párrafo 1.7

Mounting position always to be specified when ordering.
Terminal board position see page C13 (PM=1).

*A la hora de realizar el pedido se ruega precisar la posición de montaje y la posición de la caja de bornes.
Posición borne v. pág. C13 (PM=1)*

3.5 Radial load

Any transmission device coupled to the output shaft generates radial loads Fr_2 .

The load values reported in the table, depending on input and output speed, are to be considered as acting at the half-way point of the projection; if the load is applied at 1/3 of the projection, increase the values in the table by 25%; if the load is applied at 2/3, reduce the values by 25%.

Axial loads applicable at output F_{a2} are reported in the tables.

With regard to double projecting shafts, each end can sustain a radial load which equals 3/5 of the values listed in the table, on condition that they act in the same direction and have the same intensity.

3.5 Cargas radiales

Cada clase de órgano de transmisión que es conectado al eje de salida determina cargas radiales Fr_2 .

Los valores señalados en la tabla en función a las varias velocidades de entrada y salida se suponen aplicándolas en la mitad del eje como fuerzas agentes a esto; para una ubicación de 1/3 de la longitud se aumentará hasta un 25% los valores de la tabla, mientras para una posición de 2/3 de la longitud se disminuirá los mismos valores a un 25%.

Los valores de las cargas axiales aplicables en salida F_{a2} están señalados en las tablas.

En los ejes con salida doble, cada extremidad puede soportar una carga radial igual a 3/5 del valor de la tabla, siempre y cuando las cargas aplicables sean de igual intensidad y reaccionen en el mismo sentido.

3.5 Radial load

3.5 Cargas radiales

Helical gear reducers RCV

4.1 Characteristics

VARMEC gear reducers and motor-reducers have been entirely designed using leading edge technical computer software. Each single component has been designed and tested in consideration of the maximum loads applicable to the reducer in compliance with AGMA 2001-B88.

Casings and flanges made from non varnished aluminium in sizes 141 - 191 - 162 - 202A - 252A - 253A - 302A - 303A. Casings and flanges of all other sizes are made from varnished, highly resistant cast iron. The rounded shape of the casings gives the gear reducers an optimum rigidity and solidity allowing for use in all possible assembly positions.

The manufacturing process of the various components is done by modern CNC machinery that gives maximum precision construction.

All gears are made from hardened and tempered alloy steel with successive corrections to better the performance and reduce noise levels even whilst running with a load.

The input shaft is made from hardened and tempered alloy steel; the output shaft from high strength steel. Gear reducers are varnished with a thermosetting powder based on polyester resins modified with an epoxy resin : colour Burnt Blue RAL5010.

Further information on varnish specifics can be had by contacting our technical office

4.2 Construction shapes

Reductores de engranajes helicoidales RCV

4.1 Características

Los reductores y motorreductores VARMEC han sido proyectados completamente con el apoyo de programas técnicos computarizados. Cada uno de los componentes ha sido proyectado y verificado teniendo en cuenta la máxima carga aplicable al reductor según la normativa AGMA 2001-B88.

Carcasas y bridas en aluminio no barnizado de medidas 141 - 191 - 162 - 202A - 252A - 253A - 302A - 303A, carcasas y bridas en fundición de alta resistencia barnizadas en las otras medidas.

La forma redondeada de las carcasas confieren al reductor una óptima rigidez y una elevada compatibilidad que permite su utilización en todas las posiciones de montaje posibles.

La producción de cada uno de los componentes que integran el reductor se realiza mediante centros mecanizados de control numérico que permiten obtener la máxima precisión constructiva.

Todos los engranajes son contruidos en acero 18NiCrMo5 UNI 7846 tratados térmicamente, cementados y cada diente esta rectificado para mejorar su rendimiento y reducir su nivel de sonoridad bajo condiciones de carga.

El eje de entrada esta fabricado con acero 16CrNi4 UNI 7846 cementado y templado, y el eje de salida en acero 39NiCrMo3 UNI7845 bonificado.

Los reductores estan barnizados con polvo termo-endureciente a base de resinas de poliéster, modificadas con resinas epoxi de color azul RAL5010. Informaciones específicas del barniz se pueden pedir en la oficina técnica.

4.4 Lubrication

All VARMEC gear reducers come lubricated with a synthetic oil.

- Gear reducers size RCV-CV 14-19-24-28-16-20-25-30-35 are supplied with life lubrication.
- Gear reducers size RCV-CV 38-45-55-58-60 are usually supplied without lubricant, unless specifically stated otherwise on the order form. Users must therefore add the correct quantity of oil using the oil gauge level before any initial start-up.

For this purpose gear reducers are fitted with an oil filling cap, an oil gauge and a drain plug.

For gear reducers supplied with lubricant, we recommend that once installation is complete customers should substitute the closed plug used only during transport with the oil breather supplied.

We ask that all customers specify their required mounting position so that we at Varmec can fit plugs in the best position for adequate lubrication

Gear reducers are fitted with self-lubricating bearings type 2RS whenever a mounting position requires a gear reducer with a vertical axle and consequently where the shaking of the oil during running times wouldn't be enough to guarantee a correct lubrication to the upper bearings.

4.5 Quantity of lubricant

4.4 Lubrication

Todos los reductores de producción VARMEC son provistos de lubricación a aceite sintético.

- Los reductores de los tamaños RCV-CV 14-19-24-28-16-20-25-30-35 son equipados con lubricación permanente.
- Los reductores de la serie RCV-CV 38-45-55-58-60 se suministran normalmente sin lubricante, sino está especificado en el pedido, y será el cliente quien antes de la puesta en marcha pondrá la cantidad necesaria de aceite refiriéndose a la línea mediana del tapón.

Los reductores llevan tapones de carga, descarga y nivel de aceite, para los reductores completos de lubricante se recomienda, después de la instalación de sustituir el tapón utilizado para el transporte con el tapón respiradero incluido.

Para preparar la correcta orientación de los tapones para una adecuada lubricación aconsejamos especificar siempre la posición de montaje deseada. En las posiciones de montaje de reductores con eje vertical, donde el batimiento del aceite durante el funcionamiento no es suficiente para garantizar la correcta lubricación de los cojinetes superiores, se instalan cojinetes lubricantes tipo 2RS.

Para preparar la correcta orientación de los tapones para una adecuada lubricación aconsejamos especificar siempre la posición de montaje deseada. En las posiciones de montaje de reductores con eje vertical, donde el batimiento del aceite durante el funcionamiento no es suficiente para garantizar la correcta lubricación de los cojinetes superiores, se instalan cojinetes lubricantes tipo 2RS.

4.7 Radial load

Any transmission device coupled to the input and output shaft generates radial loads.

The load values reported in the table, depending on input and output speed, are to be considered as acting at the half-way point of the projection; if the load is applied at 1/3 of the projection, increase the values in the table by 25%; if the load is applied at 2/3, reduce the values by 25%.

With regard to double projecting shafts, each end can sustain a radial load which equals 3/5 of the values listed in the table, on condition that they act in the same direction and have the same intensity.

4.7 Cargas radiales

Cada clase de órgano de transmisión que es conectado al eje de entrada y salida determina cargas radiales.

Los valores señalados en la tabla en función a las varias velocidades de entrada y salida se suponen aplicándolas en la mitad del eje como fuerzas agentes a esta; para una ubicación de 1/3 de la longitud se aumentará hasta un 25% los valores de la tabla, mientras para una posición de 2/3 de la longitud se disminuirá los mismos valores a un 25%.

En los ejes con salida doble, cada extremidad puede soportar una carga radial igual a 3/5 del valor de la tabla, siempre y cuando las cargas aplicables sean de igual intensidad y reaccionen en el mismo sentido.

Shaft-mounted reducers RFV

5.1 Characteristics

VARMEC reducers and gearmotors have been designed entirely with the aid of technical computer programs. Every single component has been checked and designed taking into account the maximum load applicable to the reducer according to the AGMA 2001-B88 regulation, in compliance with the modularity characteristics.

Casings and flanges are made of unpainted aluminium in sizes 252-253, 302-303, while the casings and flanges made of high resistance cast-iron are painted in the other sizes. The rounded shape of the casings gives the reducers excellent rigidity and solidity and allows them to be used in all possible assembly positions.

The various components are processed on modern CNC machinery, ensuring maximum constructive precision.

All gears are made of alloyed, hardened and tempered steel with subsequent grinding on the sides of the teeth to improve performance and silent operation even under load. Approximate maximum sound level values 75dB.

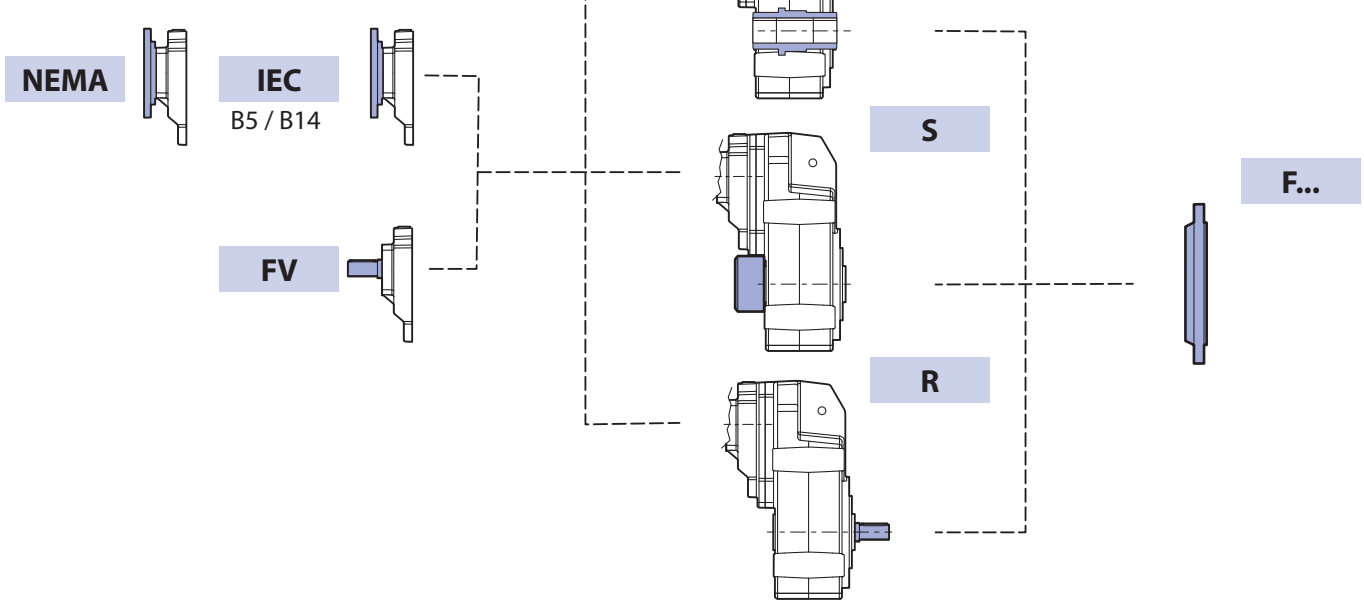

The input shaft is made of alloyed, cemented and hardened steel; the output shaft is made of reclaimed steel.

The reducers are painted with a polyester resin-based thermosetting powder, modified with epoxy resin, in RAL5010 Textured Blue.

More information on the paint specifications can be requested from our Technical Department.

RFV ...

Reductores pendulares RFV

5.1 Características

Los reductores y los motorreductores VARMEC se han diseñado por dentro con programas técnicos basados en programas de ordenador.

Cada componente se ha comprobado y diseñado considerando la carga máxima aplicable al reductor, según la normativa AGMA 2001-B88 respetando las características de modularidad.

Cajas y bridas de aluminio sin pintar de tamaño 252-253, 302-303, cajas y bridas de fundición de alta resistencia pintadas en otros tamaños. La forma monolítica de las cajas aporta una excelente rigidez a los reductores y un alto nivel de compacidad y permite que se usen en todas las posiciones posibles de montaje.

Las elaboraciones de los diferentes componentes se producen en centros de mecanizado modernos, con control numérico, que permiten la máxima precisión de fabricación.

Todos los engranajes se han fabricado con aleación de acero, cementados y templados con la sucesiva elaboración de rectificado en los lados de los dientes, para mejorar el rendimiento y para que el funcionamiento incluso bajo carga, sea lo más silencioso posible. Valores indicativos máximos de nivel sonoro 75dB.

El eje de entrada se ha fabricado con acero aleado, cementado y templado, el de salida en acero bonificado.

Los reductores se pintan con polvo de endurecimiento termoestable a base de resinas de poliéster modificadas con resina epoxi de color Azul genciana RAL5010.

Se puede solicitar más información sobre las especificaciones de la pintura a nuestro Departamento Técnico.

5.4 Lubrication

All gearboxes manufactured by VARMEC are designed with synthetic oil lubrication.

Gearboxes from size RFV 25.. to RFV 40.. are supplied with lubricant from the factory. These gearboxes do not require periodic lubricant replacement throughout their service life.

The gearboxes of the RFV 502-503 series are normally supplied without lubricant, if not specified in the order, and it is the customer's responsibility to introduce the correct amount of lubricating oil before commissioning.

In this regard, the gearboxes are fitted with filler caps, drain and oil level plugs; for gearboxes supplied with lubricant it is recommended, after installation, to replace the closed plug used for transport, with the breather plug provided.

In order to fit the plugs with the correct orientation, it is recommended to always specify the desired assembly position for proper lubrication. In the assembly positions that feature gearboxes with a vertical axis (H5, H6), where the oil splashing during operation would not be enough to ensure proper lubrication of the upper bearings, type 2RS self-lubricating bearings are fitted.

To fill the gearbox properly, refer to the centreline of the level plug.

With respect to this condition, the quantity of lubricant shown in table 1 may feature deviations.

The operation of the gearboxes is permitted for ambient temperatures ranging between -20°C and +40°C.

5.5 Quantity of lubricant

5.4 Lubrication

Todos los reductores de producción de la empresa VARMEC llevan lubricación con aceite sintético.

Los reductores del tamaño RFV 25.. al RFV 40.. se suministran lubricados de fábrica. Estos reductores no necesitan la sustitución periódica del lubricante durante toda su vida útil.

Los reductores de la serie RFV 502-503 normalmente se suministran sin lubricante, si no se especifica en el pedido, el cliente debe introducir la cantidad adecuada de aceite antes de la puesta en servicio.

Para ello los reductores están equipados con tapones de carga, descarga y de nivel para los reductores que se suministran con lubricante, se aconseja que después de la instalación se cambie el tapón cerrado, usado para el transporte, con el tapón de purga que se suministra.

Para orientar correctamente los tapones, para lubricar adecuadamente, recomendamos indicar siempre la posición en la que desea montarlos. En las posiciones de montaje que prevén los reductores con un eje vertical (H5, H6), después de que el aceite sea sacudido mientras funciona, esto no es suficiente para asegurar la lubricación correcta de los cojinetes superiores, se montan cojinetes con lubricación automática tipo 2RS.

Para el llenado correcto del reductor se deberá tomar como referencia absoluta el nivel a mitad del tapón.

Respecto a esta condición, la cantidad de lubricante indicada en la tabla 1 puede sufrir variaciones.

El funcionamiento de los reductores se admite para temperaturas ambiente entre los -20°C y los +40°C.

5.5 Cantidad de lubricante

Permanent lubrication / Lubricación permanente

Amount of oil expressed in gal [lt] / Cantidad de aceite expresada en gal [lt]

5.6 Assembly positions

5.6 Posiciones de montaje

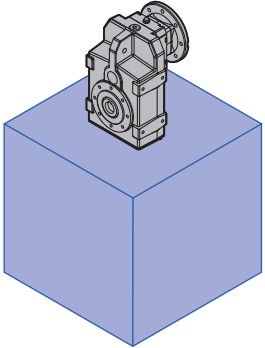

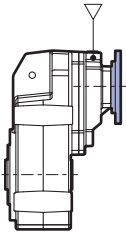

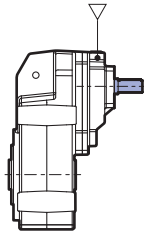

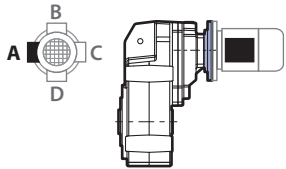

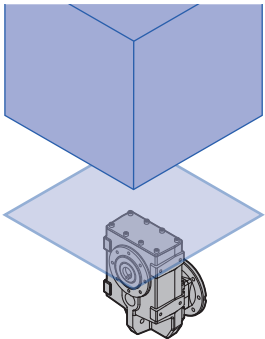

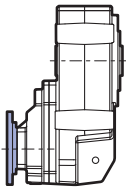

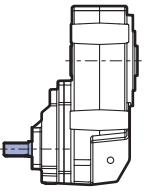

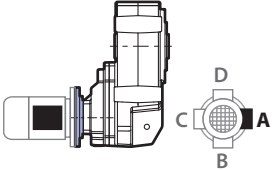

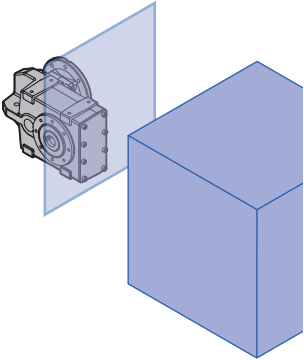

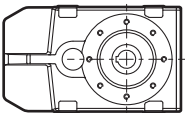

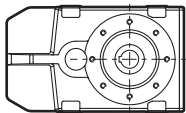

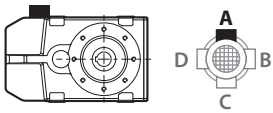

The tables below should be used as a reference for the interpretation of the assembly positions, the position of the plugs and the quantities of lubricant.

Las tablas siguientes sirven de referencia para interpretar las posiciones de montaje, la colocación de los tapones y la cantidad de lubricante.

5.7 Radial load

Any transmission device coupled to the input and output shaft generates radial loads.

The load values reported in the table, depending on input and output speed, are to be considered as acting at the half-way point of the projection; if the load is applied at 1/3 of the projection, increase the values in the table by 25%; if the load is applied at 2/3, reduce the values by 25%.

With regard to double projecting shafts, each end can sustain a radial load which equals 3/5 of the values listed in the table, on condition that they act in the same direction and have the same intensity.

5.7 Cargas radiales

Cada clase de órgano de transmisión que es conectado al eje de entrada y salida determina cargas radiales.

Los valores señalados en la tabla en función a las varias velocidades de entrada y salida se suponen aplicándolas en la mitad del eje como fuerzas agentes a esta; para una ubicación de 1/3 de la longitud se aumentará hasta un 25% los valores de la tabla, mientras para una posición de 2/3 de la longitud se disminuirá los mismos valores a un 25%.

En los ejes con salida doble, cada extremidad puede soportar una carga radial igual a 3/5 del valor de la tabla, siempre y cuando las cargas aplicables sean de igual intensidad y reaccionen en el mismo sentido.

Anti-vibration kit

Kit antivibraciones

The RFV series shaft-mounted reducers can be equipped, on request, with an anti-vibration kit that includes the components required for mounting the reducer (reaction arm excluded).

The dimensions are shown in the table below.

Los reductores pendulares de la serie RFV pueden equiparse bajo pedido con un kit antivibrante, que incluye los componentes necesarios para la fijación pendular (excluyendo el brazo de reacción).

Las dimensiones se indican en la tabla siguiente.

RFV		D1	D2	H	L1	L2	M	P	R	S1	S2 (max)	Mt
