Mechanical Power Transmission

WE LOVE OUR PRODUCTS.

"We are proud to be a European manufacturer; it is a privilege to supply our products to some of the world's most prestigious original equipment manufacturers in the Agricultural, Automotive, Construction, Industrial and Motor Sport sectors".

"Our distributor network is vital to the continued global growth of the DUNLOP brand and our valued distributor partners form the perfect link between manufacturer and end user".

"Our commitment to our staff, our customers and the environment is of paramount importance to our company, we will continue to develop our organisational skills to further enhance our company's potential, to engage in sustainable practices and anticipate the needs and expectations of our customers".

"We love our products".

Ray Mifsud, *Managing Director.*

TENSIONING TECHNOLOGY

Chain & V-Belt Tensioning

Roller chains are power transmission components with positive transmission which, by virtue of their design are subject, depending on quality, to elongation as a result of wear of 1 to 3% of their total length. In spite of this elongation, due to aging, a roller chain transmits the occurring torques effectively providing it is periodically re-tensioned. Without tension adjustment, the slack side of the chain becomes steadily longer, oscillates and reduces the force transmitting wrap angle of the chain on the sprockets.

The chain no longer runs smoothly off the teeth of the sprockets, producing uneven running of the entire drive and supporting wear. The service life of the chain drive can be extended considerably by the use of an automatic chain tension adjuster. The tensioning element prevents the slack side of the chain from 'sagging' or 'slapping' by its automatic operation and very wide tensioning range for compensating this given elongation.

The DUNLOP tensioning element is based on the rubber spring principle. According to application it is supplemented with the appropriate idler sprocket for chain drives or with a belt roller pulley in belt tensioner applications.

Pre-tensioning

With the tensioning element the necessary travel and simultaneously the corresponding initial tension force can be accurately adjusted by a torsion angle scale and indicating arrow. Excessive initial pre-tensioning of the chain should be avoided in order to reduce the tensile force and surface pressure on the links.

Vibration Damping

The DUNLOP tensioning element, based on a system of rubber springs, absorbs considerably the chain vibration due to internal molecular friction in the rubber inserts. The rubber spring effectively absorbs the vibrations, resulting from the polygon effect, which also positively influences the noise level of the complete chain drive.

INSTALLATION

The idler sprocket is installed in arm position 'normal' or 'hard' in the required position and secured with the supplied nuts.

The laterally adjustable bearing on the thread permits simple and rapid adjustment of the idler sprocket to the chain track. The central fixing of the tensioning element with a single screw saves a great deal of time in installation. In addition, only one fixing hole is required on the 'machine side'.

On smooth, clean and torsionally rigid surfaces the resistance of the frictional contact between the tensioner housing and the machine element is a multiple of the maximum initial tensioning torque at 30°.

TENSIONER TYPE SE

The tensioning element with the specification SE (SE 11 to SE 45) is the mostly used standard unit for tensioning all kinds of chain and belt drives. This unit is designed for applications in temperature range from -40°C to +80°C.

Dunlop Idler Sprocket Set Type N
The DUNLOP idler sprocket set completes the tensioning element for applications in chain drives. The idler sprocket runs on a self-lubricating ball bearing Type 2 Z.

Dunlop Idler Roller Pulley Set Type R
The DUNLOP idler roller pulley set installed on the relevant SE unit is an ideal belt tensioner. The roller is made of high quality industrial plastic material with two self lubricating ball bearings Type 2 Z.

GENERAL INFORMATION

DUNLOP tensioners should be installed on a stiff, even and clean machine part means of the central bolt. The frictional connection on flange is usually fully sufficient for final positioning. The positioning notch on flange can be used to assure the tensioner additionally on uneven and dirty surfaces by setting a roller pin.

Tensioning Force F
The tensioning force can be continuously adjusted. The max. pre tensioning angle is + 30° out of neutral position. Tensioning force table for types SE by using hole-position 'normal' for idler sprocket & idler roller pulley fixation.

Size SE	Pre-tension < 10°		Pre-tension < 20°		Pre-tension < 30°	
	F (N)	s (mm)	F (N)	s (mm)	F (N)	s (mm)
11	15	14	40	28	80	40
15	25	17	65	34	135	50
18	75	17	180	34	350	50
27	150	22	380	44	800	65
38	290	30	730	60	1500	87
45	500	39	1300	78	2600	112

When fixing the idler sprockets and idler roller pulleys in arm position 'hard', the tensioning force will increase by about 25%.

Tensioning Force F
Table mentioning the tightening moment for the central screw (included in scope of delivery).

Thread Size	Quality 8.8
M6	10 Nm
M8	25 Nm
M10	49 Nm
M12	86 Nm
M16	210 Nm
M20	410 Nm

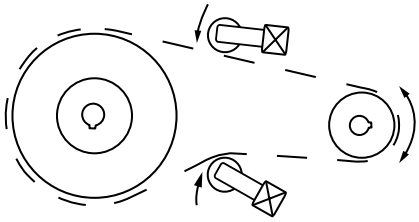
Mounting Instructions

Normal Positioning

The DUNLOP tensioning elements are always positioned on the slack side of the chain. They should be fitted as close as possible to the big wheel and hide the chain from the outer side. The ideal positioning of the tensioning arm is nearly parallel to the chain drive.

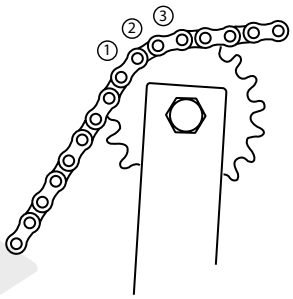
Reversible Chain Drives

The tensioning elements must be placed on both sides of the chain. Due to the reversible function there results a much higher pressure on the load side than on the slack side of the chain. It is therefore advised to use oversized tensioning elements and a pretension angle of max 15°.



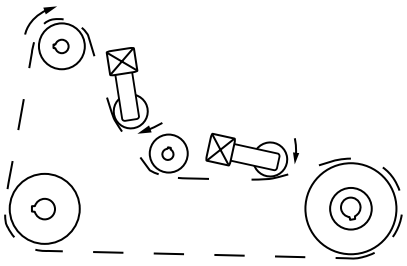
Chain Engagement

At least 3 teeth of the idler sprocket must engage into the roller chain when tensioning the chain for the first time. The minimum number of engaged sprocket teeth between the tensioning wheel and chain is 3.



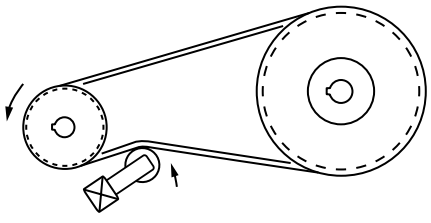
Mounting

The chain tensioner must be adjusted in the axial and angular direction. The tensioning area should be nearly in parallel position to the chain and in the direction of the chain's drive. In case the chain drives are extremely long it is possible to fit several chain tensioners in order to obtain better tensioning and compensation.



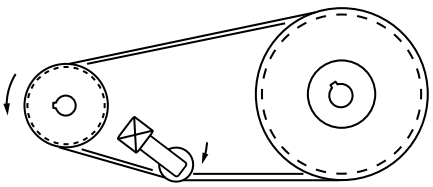
V-Belt Tensioner - Outer Roller

Please refer to the instructions of the belt manufacturer for further information on the belt structure when mounting our DUNLOP belt tensioning elements with flat rollers on the back of the belt. Inner or outer tension rollers must be positioned as far away as possible from the next V-Belt pulley the belt is guided to.



V-Belt Tensioner - Inner Grooved Pulleys

V-Belt pulleys can be mounted as inner rollers at any position on the slack side of the V-Belt (for drives with long axial distances and a high level of vibration we recommend to use pulleys with deep grooves).



INSTRUCTIONS FOR BELT DRIVES

Selection of the adequate DUNLOP Tensioner size

Selection table mentioning the most conventional V-Belt types.

V-Belt Type	Width (mm)	Height (mm)	Diam. of smaller pulley (mm)	Initial operation test-force F_I** (N)	Initial operation test-force F_o** (N)	Size SE* (without SE-W and SE-B)

$$F = F_I \cdot z \cdot 2$$

*General basic selection criteria:

F Resulting tensioning force by a pre-tension angle of 20°.

F_I Initial operation test-force according guidelines of the belt manufacturer.

z Quantity of belts in drive.

2 Multiplier for the compensation of belt slippage and/or of centrifugal force generated on belt strands.

**required test-force for belt deflection of 16mm per 1000mm of centre distance. The relevant deflection by shorter or longer centre distance has to be interpolated accordingly.

DUNLOP

TENSIONERS

BELT AND CHAIN TENSIONERS

Description

Tensioning devices SE are available for both roller chain and V-Belt applications.

A range of idler sprockets to suit standard roller chain pitch sizes from 06B-1 to 24B-1 are available.

A range of idler roller pulleys are also available to suit standard V and wedge belt sections from Z/SPZ to C/SPC. Both designs have 2Z bearings fitted to the bore.

MOTOR BASES

MOTOR BASES

Description

The fastest and most economical method of securing motors to machine beds. The five sizes are manufactured from galvanised steel and they can accommodate motor frame sizes 63 to 180. They have four slotted holes for fastening the base to the foundation.

Motor base range from SL210 to SL490.

Specification

The fastest and most economical method of securing motors to machine beds. The five sizes are manufactured from galvanised steel and they can accommodate motor frame sizes 63 to 180. They have four slotted holes for fastening the base to the foundation.

Alignment

The pressed top plate is designed to slide over the base plate preventing vibration and noise whilst ensuring continuous belt alignment. Belts are tensioned by adjusting a single screw.

Motor Mount

The motor is bolted to the two piece top plate which accommodates a wide range of motors. Centre distance adjustments can be made without the need to loosen the motor bolts.

"We are proud to be a European manufacturer; it is a privilege to supply our products to some of the world's most prestigious original equipment manufacturers in the Agricultural, Automotive, Construction, Industrial and Motor Sport sectors".

"Our distributor network is vital to the continued global growth of the DUNLOP brand and our valued distributor partners form the perfect link between manufacturer and end user".

"Our commitment to our staff, our customers and the environment is of paramount importance to our company, we will continue to develop our organisational skills to further enhance our company's potential, to engage in sustainable practices and anticipate the needs and expectations of our customers".

"We love our products".

Ray Mifsud, *Managing Director.*
